

# Memories: a practical primer

- The good news: huge selection of technologies
  - Small & faster vs. large & slower
  - Every year capacities go up and prices go down
  - New kid on the block: high density, fast flash memories
    - Non-volatile, read/write, no moving parts! (robust, efficient)
- The bad news: perennial system bottleneck
  - Latencies (access time) haven't kept pace with cycle times
  - Separate technology from logic, so must communicate between silicon, so physical limitations (# of pins, R's and C's and L's) limit bandwidths
    - New hopes: capacitive interconnect, 3D IC's
  - Likely the limiting factor in cost & performance of many digital systems: designers spend a lot of time figuring out how to keep memories running at peak bandwidth
  - "It's the memory, stupid"

# Memories in Verilog

- `reg bit; // a single register`
- `reg [31:0] word; // a 32-bit register`
- `reg [31:0] array[15:0]; // 16 32-bit regs`
- `wire [31:0] read_data,write_data;`  
`wire [3:0] index;`  
  
`// combinational (asynch) read`  
`assign read_data = array[index];`  
  
`// clocked (synchronous) write`  
`always @ (posedge clock)`  
`array[index] <= write_data;`

# Multi-port Memories (aka regfiles)

```
reg [31:0] regfile[30:0]; // 31 32-bit words

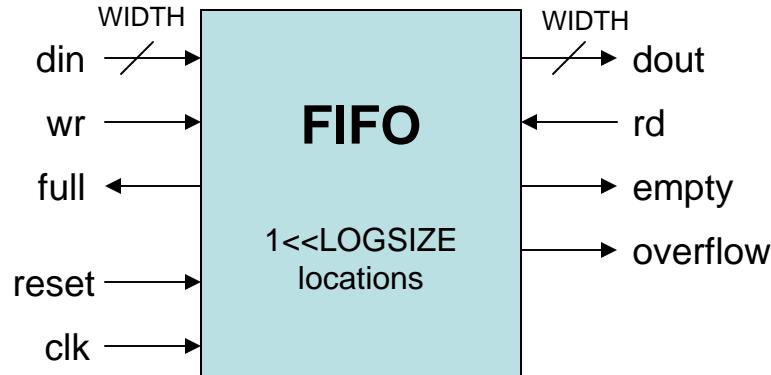

// Beta register file: 2 read ports, 1 write
wire [4:0] ra1,ra2,wa;
wire [31:0] rd1,rd2,wd;

assign ra1 = inst[20:16];
assign ra2 = ra2sel ? inst[25:21] : inst[15:11];
assign wa = wasel ? 5'd30 : inst[25:21];

// read ports
assign rd1 = (ra1 == 31) ? 0 : regfile[ra1];
assign rd2 = (ra2 == 31) ? 0 : regfile[ra2];
// write port
always @ (posedge clk)
  if (werf) regfile[wa] <= wd;

assign z = ~| rd1; // used in BEQ/BNE instructions
```

# FIFOs

```
// a simple synchronous FIFO (first-in first-out) buffer
// Parameters:
//   LOGSIZE  (parameter) FIFO has 1<<LOGSIZE elements
//   WIDTH    (parameter) each element has WIDTH bits
// Ports:
//   clk      (input) all actions triggered on rising edge
//   reset    (input) synchronously empties fifo
//   din      (input, WIDTH bits) data to be stored
//   wr       (input) when asserted, store new data
//   full     (output) asserted when FIFO is full
//   dout     (output, WIDTH bits) data read from FIFO
//   rd       (input) when asserted, removes first element
//   empty    (output) asserted when fifo is empty
//   overflow (output) asserted when WR but no room, cleared on next RD
module fifo(clk,reset,din,wr,full,dout,rd,empty,overflow);
  parameter LOGSIZE = 2; // default size is 4 elements
  parameter WIDTH = 4; // default width is 4 bits
  ...
endmodule
```

```

// a simple synchronous FIFO (first-in first-out) buffer
// Parameters:
//   LOGSIZE (parameter) FIFO has 1<<LOGSIZE elements
//   WIDTH (parameter) each element has WIDTH bits
// Ports:
//   clk (input) all actions triggered on rising edge
//   reset (input) synchronously empties fifo
//   din (input, WIDTH bits) data to be stored
//   wr (input) when asserted, store new data
//   full (output) asserted when FIFO is full
//   dout (output, WIDTH bits) data read from FIFO
//   rd (input) when asserted, removes first element
//   empty (output) asserted when fifo is empty
//   overflow (output) asserted when WR but no room, cleared on next RD
module fifo(clk,reset,din,wr,full,dout,rd,empty,overflow);

parameter LOGSIZE = 2; // default size is 4 elements
parameter WIDTH = 4; // default width is 4 bits

parameter SIZE = 1 << LOGSIZE; // compute size

input clk,reset,rd,wr;
input [WIDTH-1:0] din;
output [WIDTH-1:0] dout;
output full,empty,overflow;

reg [WIDTH-1:0] fifo[SIZE-1:0]; // fifo data stored here
reg overflow; // true if WR but no room, cleared on RD
reg [LOGSIZE-1:0] wptr,rptr; // fifo write and read pointers

wire [LOGSIZE-1:0] wptr_inc = wptr + 1;

assign empty = (wptr == rptr);
assign full = (wptr_inc == rptr);
assign dout = fifo[rptr];

always @ (posedge clk) begin
  if (reset) begin
    wptr <= 0;
    rptr <= 0;
    overflow <= 0;
  end
  else if (wr) begin
    // store new data into the fifo
    fifo[wptr] <= din;
    wptr <= wptr_inc;
    overflow <= overflow | (wptr_inc == rptr);
  end
end

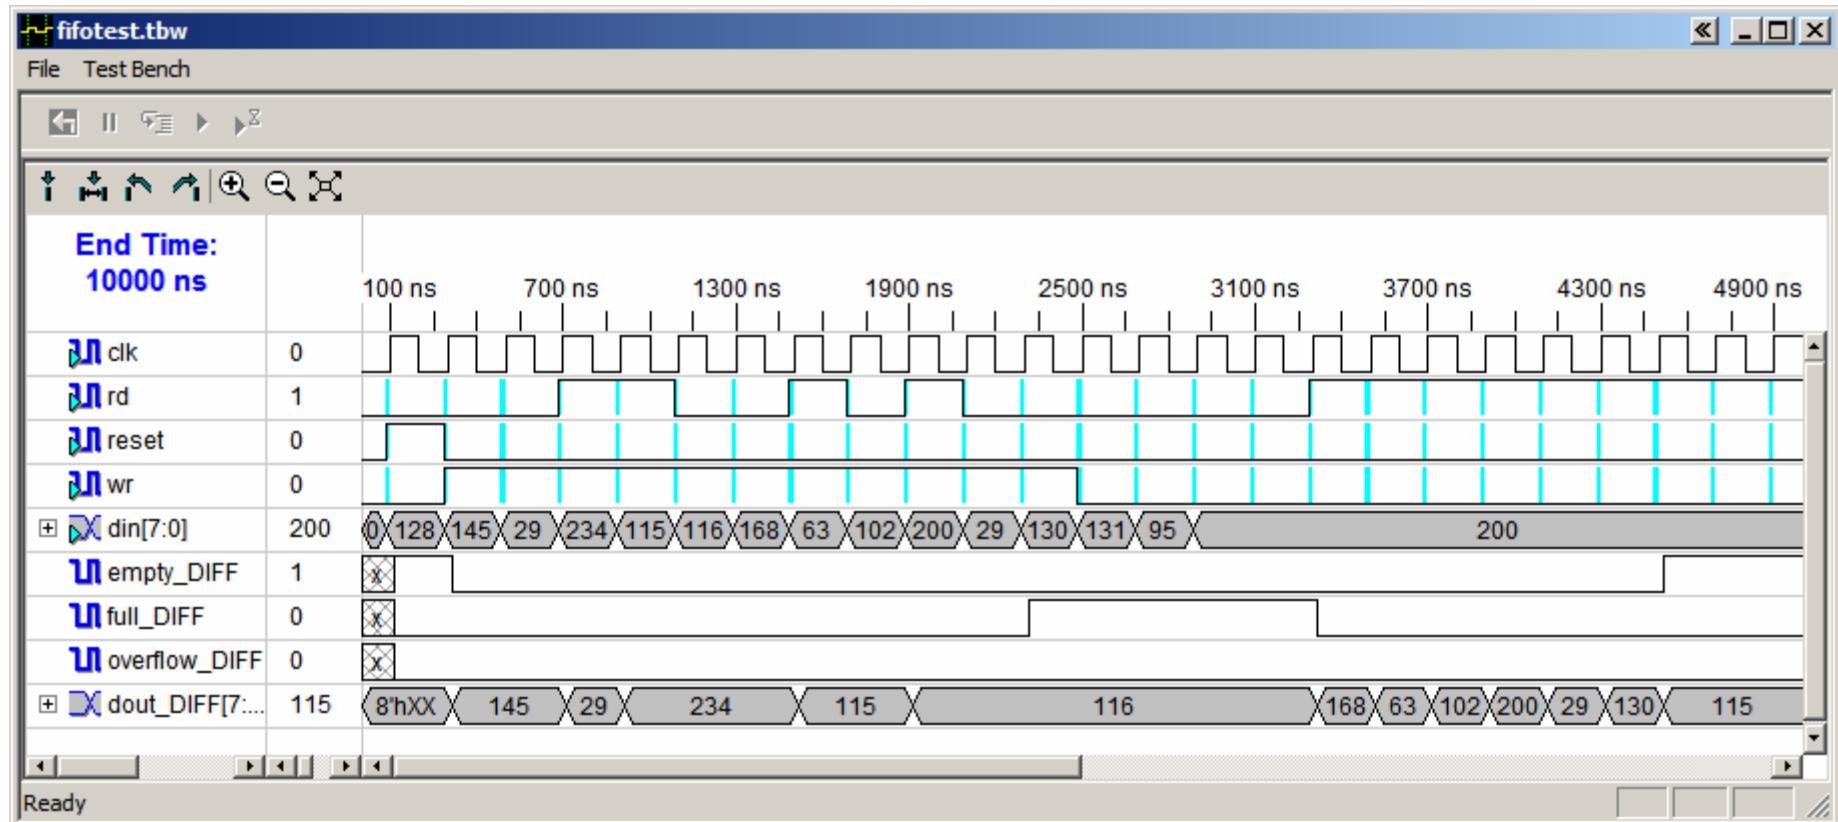

// bump read pointer if we're done with current value.
// RD also resets the overflow indicator
if (rd && (!empty || overflow)) begin
  rptr <= rptr + 1;
  overflow <= 0;
end
endmodule

```

# FIFO.V

# FIFOs in action

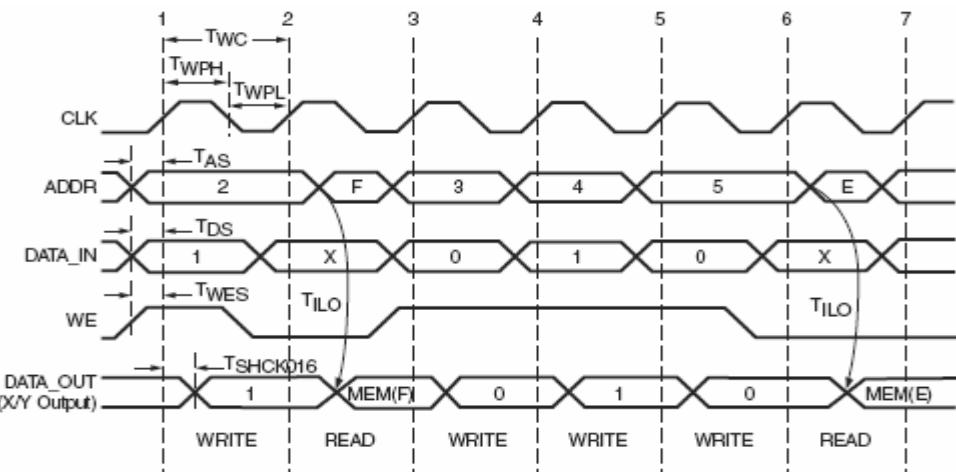

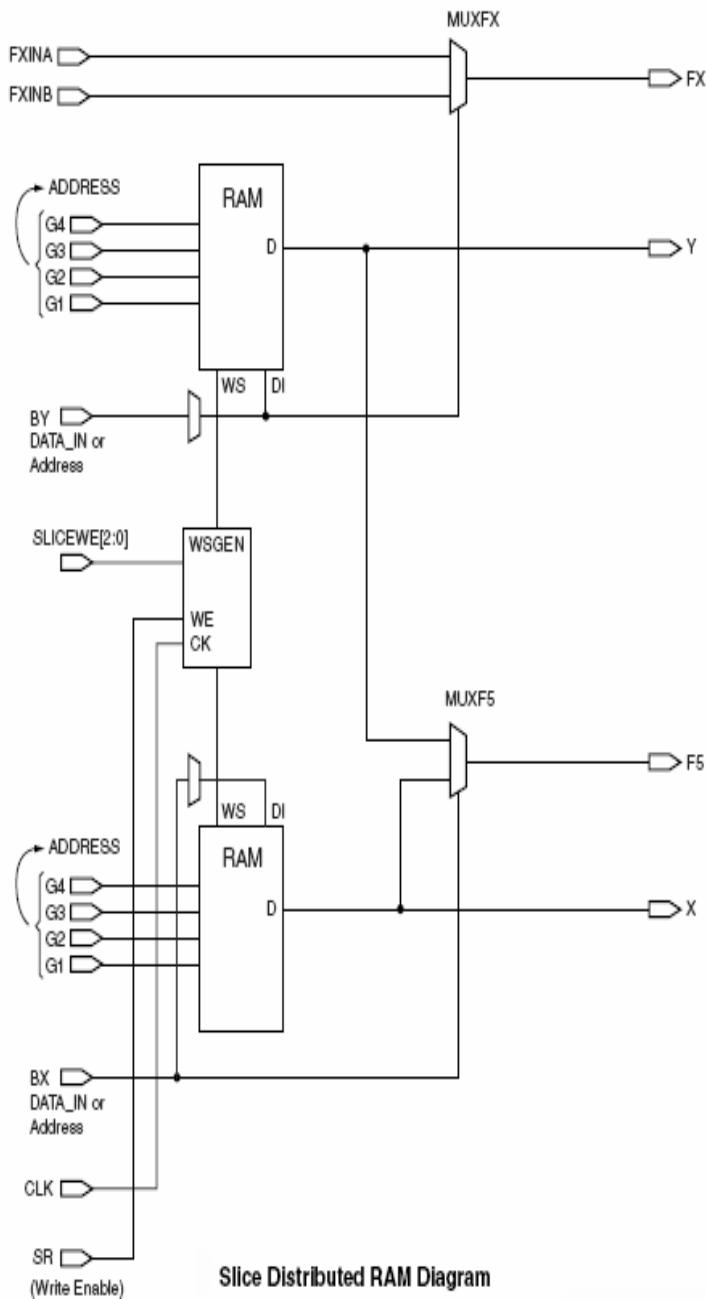

```
// make a fifo with 8 8-bit locations
fifo f8x8(clk,reset,din,wr,full,dout,rd,empty,overflow);
defparam f8x8.LOGSIZE = 3;
defparam f8x8.WIDTH = 8;
```

# FPGA memory implementation

- Regular registers in logic blocks
  - Piggy use of resources, but convenient & fast if small
- [Xilinx Vertex II] use the LUTs:
  - Single port:  $16 \times (1, 2, 4, 8)$ ,  $32 \times (1, 2, 4, 8)$ ,  $64 \times (1, 2)$ ,  $128 \times 1$
  - Dual port (1 R/W, 1R):  $16 \times 1$ ,  $32 \times 1$ ,  $64 \times 1$
  - Can fake extra read ports by cloning memory: all clones are written with the same addr/data, but each clone can have a different read address
- [Xilinx Vertex II] use block ram:
  - 18K bits:  $16K \times 1$ ,  $8K \times 2$ ,  $4K \times 4$   
with parity:  $2K \times (8+1)$ ,  $1K \times (16+2)$ ,  $512 \times (32+4)$
  - Single or dual port
  - Pipelined (clocked) operations
  - Labkit XCV2V6000: 144 BRAMs, 2952K bits total

# Using BRAMs (eg, a 64Kx8 ram)

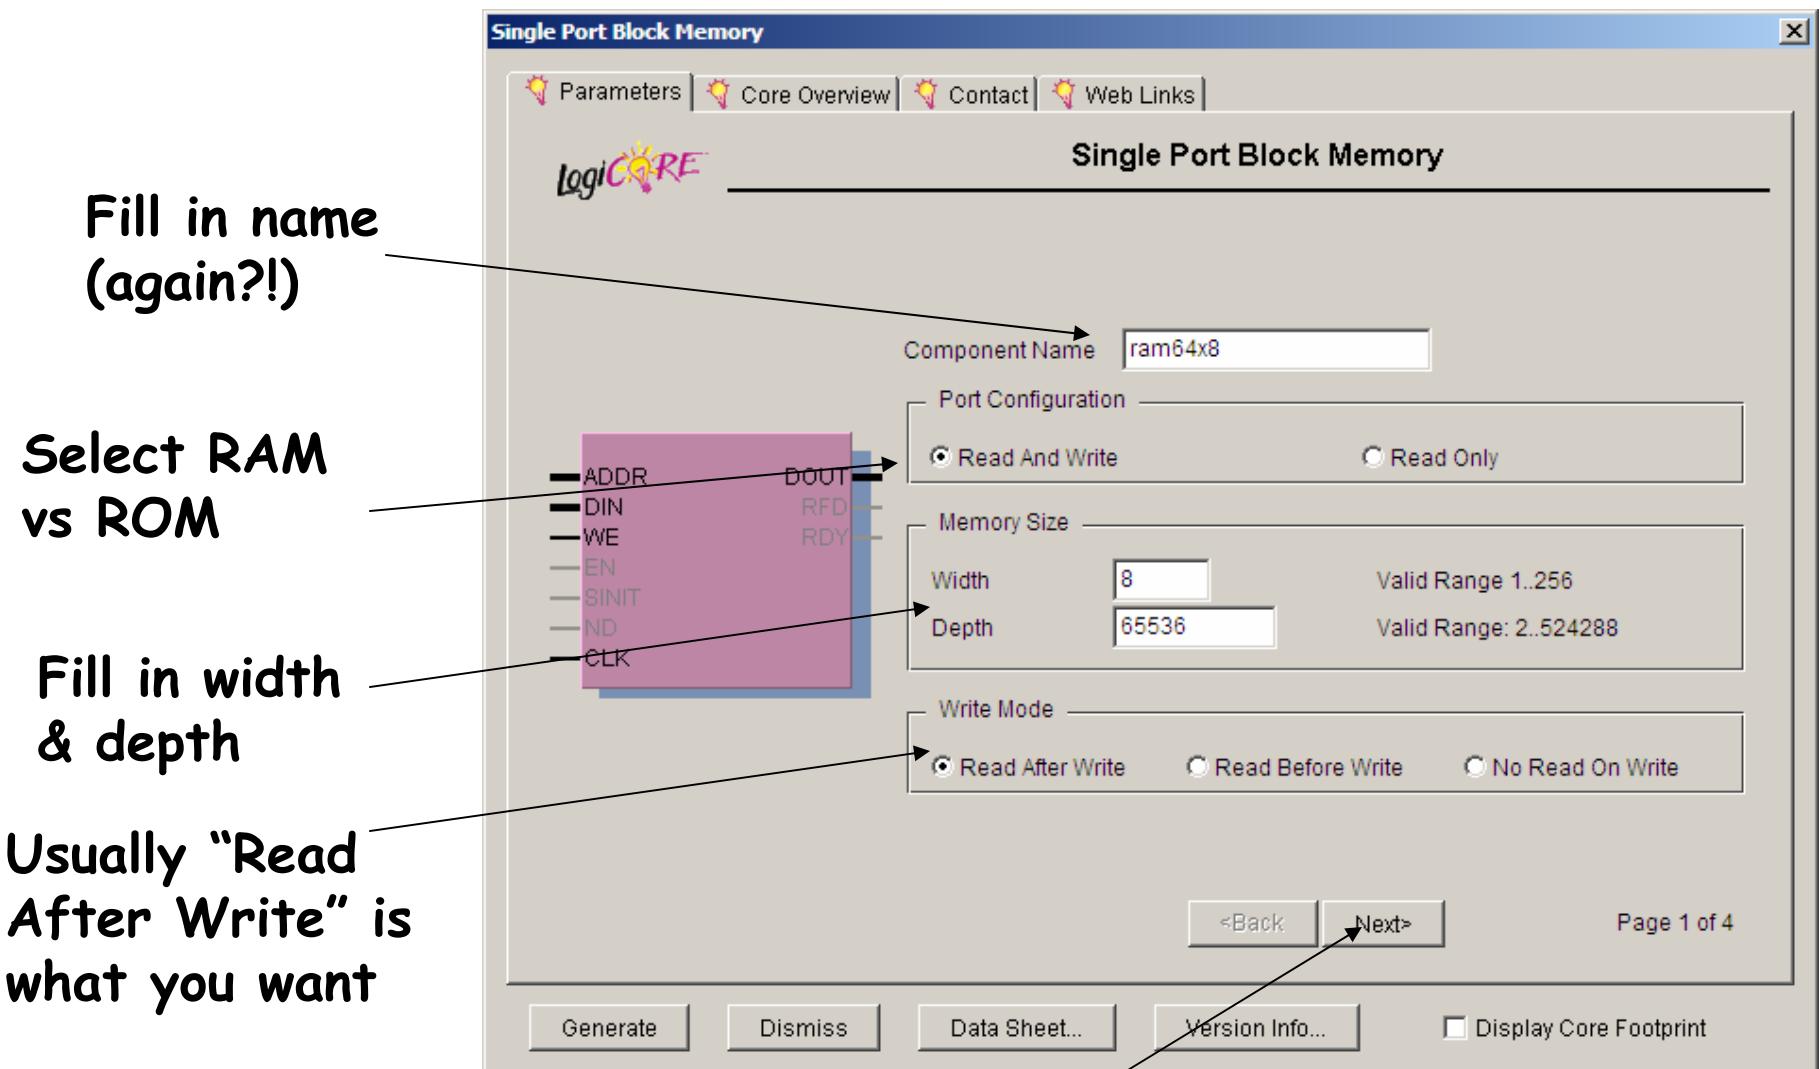

- From menus: Project → New Source...

# BRAM Example

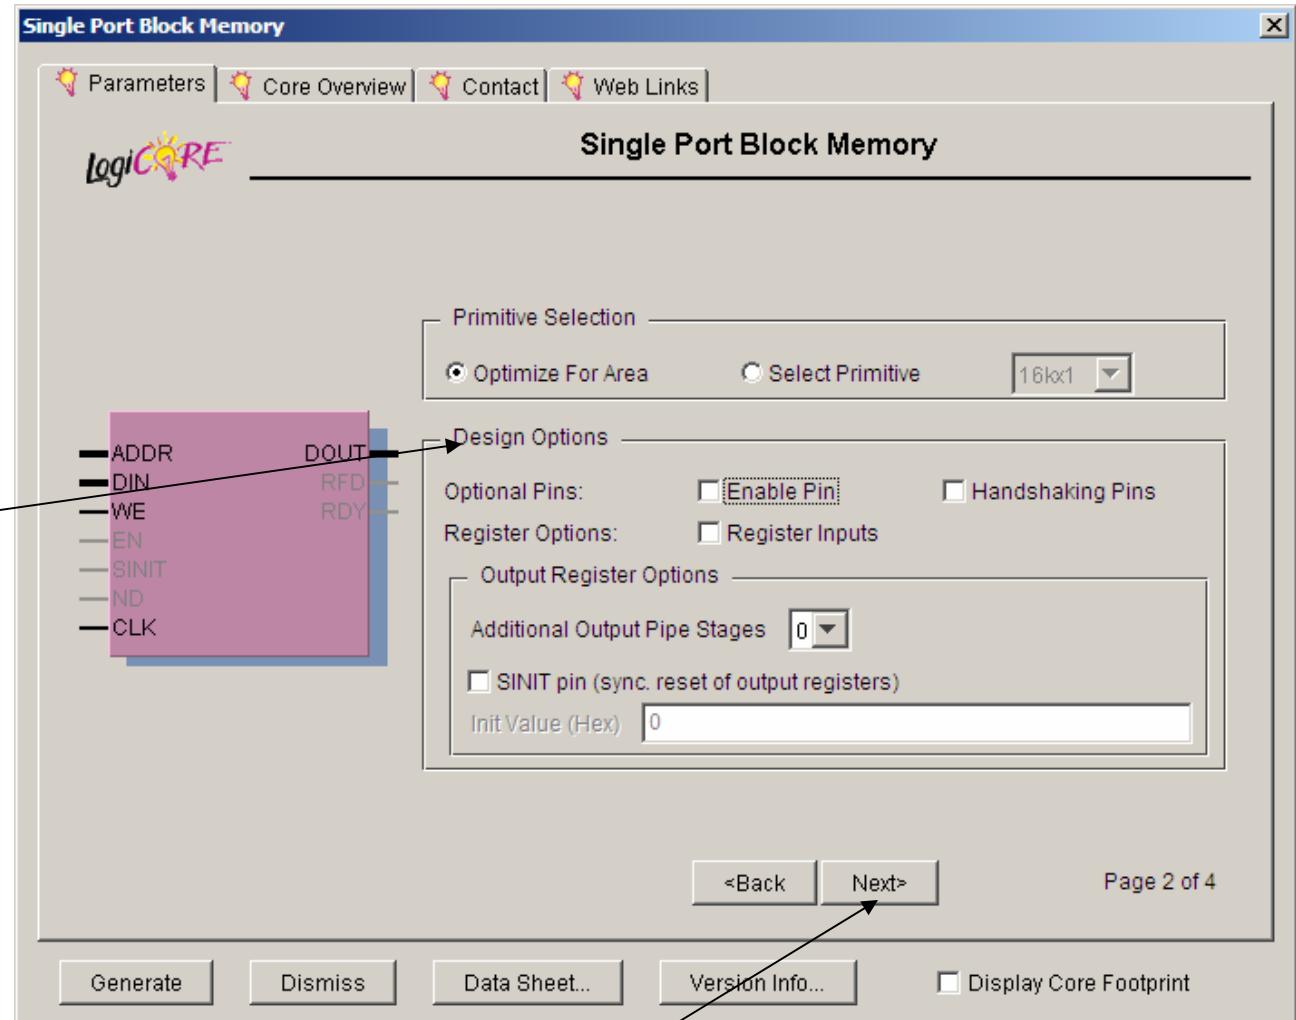

# BRAM Example

Click "Next" ...

# BRAM Example

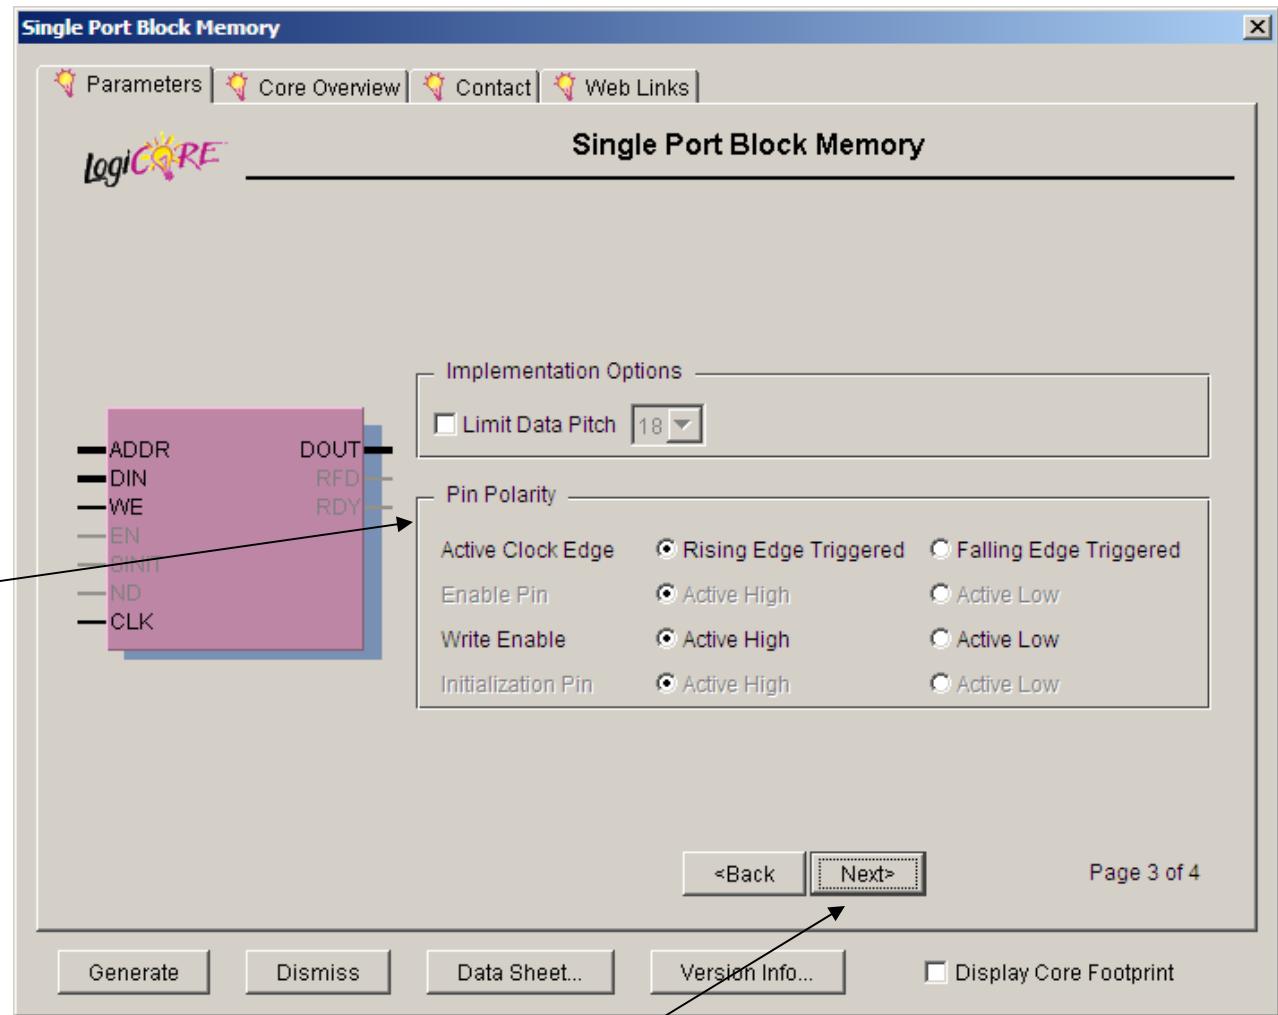

Can add extra control pins, but usually not

Click "Next" ...

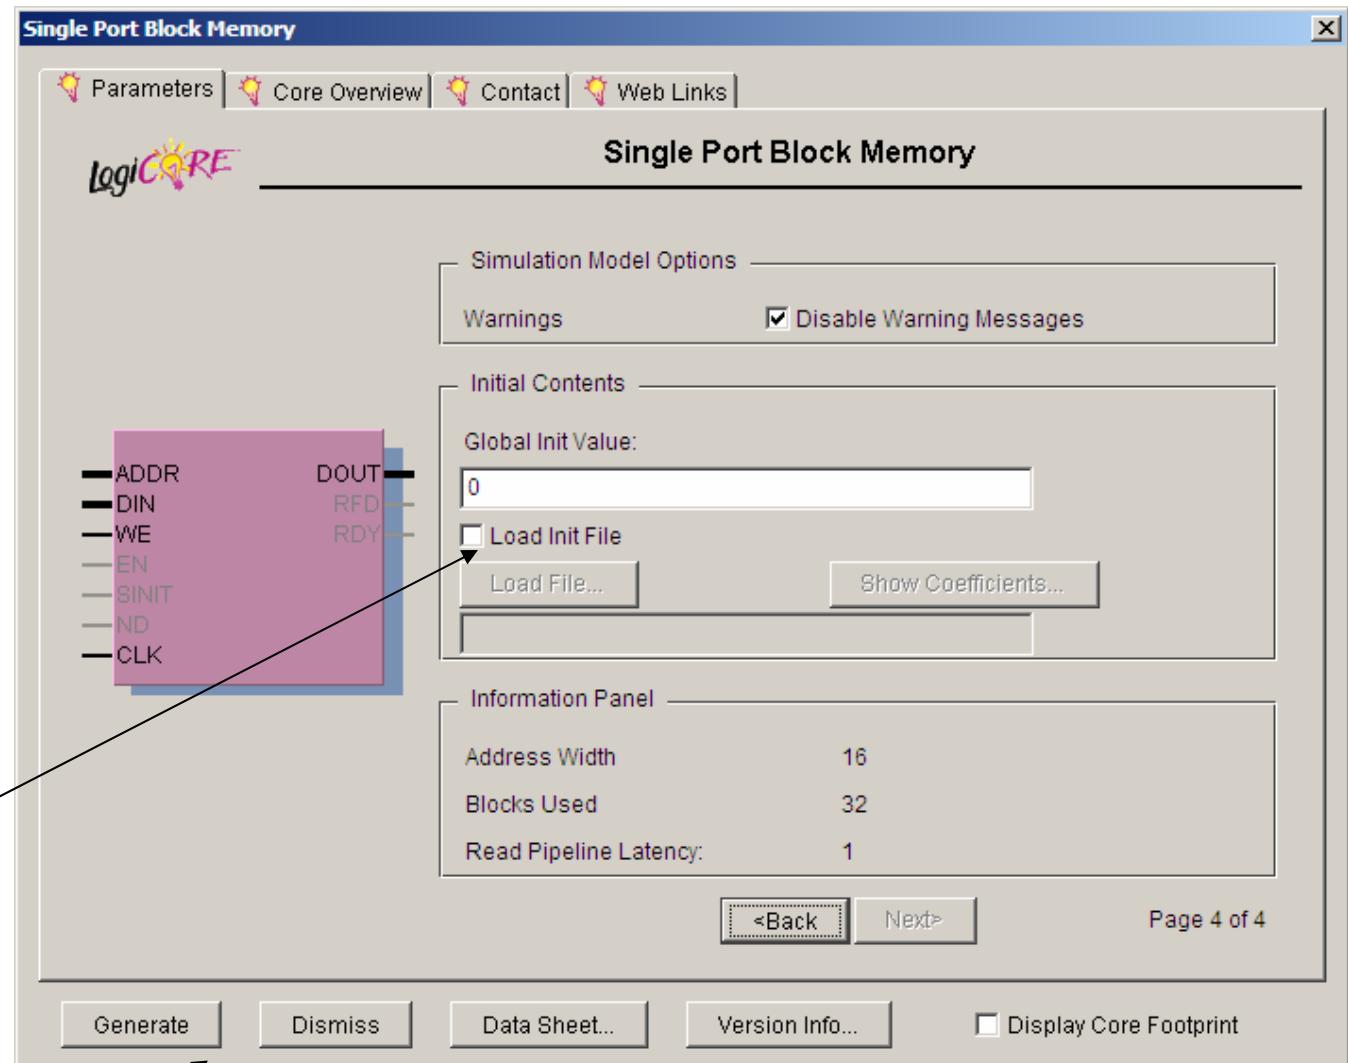

# BRAM Example

Select polarity  
of control pins;  
active high  
default is  
usually just fine

Click "Next" ...

# BRAM Example

Click to name a .coe file that specifies initial contents (eg, for a ROM)

Click "Generate" to complete

# .coe file format

```
memory_initialization_radix=2;  
memory_initialization_vector=
```

```
00000000,  
00111110,  
01100011,  
00000011,  
00000011,  
00011110,  
00000011,  
00000011,  
01100011,  
00111110,  
00000000,  
00000000,
```

Memory contents with location 0 first, then location 1, etc. You can specify input radix, in this example we're using binary. MSB is on the left, LSB on the right. Unspecified locations (if memory has more locations than given in .coe file) are set to 0.

# Using result in your Verilog

- Look at generated Verilog for module def'n:

```
module ram64x8 (addr,clk,din,dout,we);
    input [15 : 0] addr;
    input clk;
    input [7 : 0] din;
    output [7 : 0] dout;
    input we;
    ...
endmodule
```

- Use to instantiate instances in your code:

```
ram64x8 foo(addr,clk,din,dout,we);
```
