Fall 2006

Writing Recognition

Similar to current writing recognition tools found in PDAs and other mobile devices, the project aims to decipher text and numbers sketched by the movement of a mouse. The result is printed onto the screen. The recognition algorithm to be implemented will depend partly on identifying how the mouse is being moved as a means of deciding which character is being written. The user interface will allow the user to select from possible characters as well as the ability to delete characters.
