Notes for Recitation 15

Basic Counting Notions

A bijection or bijective function is a function \( f : X \to Y \) such that every element of the codomain is related to exactly one element of the domain. Here is an example of a bijection:

\[
\begin{array}{ccc}
  X & f & Y \\
  a & & 1 \\
  b & & 2 \\
  c & & 3 \\
  d & & 4 \\
  e & & 5 \\
\end{array}
\]

**Rule 1 (Bijection Rule).** If there exists a bijection \( f : A \to B \), then \( |A| = |B| \).

**Rule 2 (Sum Rule).** If \( A_1, \ldots, A_n \) are disjoint sets, then:

\[
|A_1 \cup \cdots \cup A_n| = \sum_{k=1}^{n} |A_k|
\]

**Rule 3 (Product Rule).** If \( P_1, P_2, \ldots, P_n \) are sets, then:

\[
|P_1 \times P_2 \times \cdots \times P_n| = |P_1| \cdot |P_2| \cdots |P_n|
\]

**Rule 4 (Pigeonhole Principle).** If \( |X| > |Y| \), then for every function \( f : X \to Y \) there exist two different elements of \( X \) that are mapped to the same element of \( Y \).

“If more than \( n \) pigeons are assigned to \( n \) holes, then there must exist two pigeons assigned to the same hole.”
Recitation 15

Sum and Product Rules

Problem 1. A license plate consists of either:

- 3 letters followed by 3 digits (standard plate)
- 5 letters (vanity plate)

Let \( L \) be the set of all possible license plates.

(a) Express \( L \) in terms of

\[
A = \{A, B, C, \ldots, Z\}
\]
\[
D = \{0, 1, 2, \ldots, 9\}
\]

using unions (\( \cup \)) and set products (\( \times \)).

Solution.

\[
L = (A^3 \times D^3) \cup A^5
\]

(b) Compute \(|L|\), the number of different license plates, using the sum and product rules.

Solution.

\[
|L| = |(A^3 \times D^3) \cup A^5|
\]
\[
= |(A^3 \times D^3)| + |A^5| \quad \text{Sum Rule}
\]
\[
= |A|^3 \cdot |D|^3 + |A|^5 \quad \text{Product Rule}
\]
\[
= 26^3 \cdot 10^3 + 26^5
\]

Bijections

Problem 2. For each part below, describe a bijection between the two sets mentioned. The existence of such a bijection proves that the two sets are the same size.

A good approach is to describe an element of the first set using variables and then describe the corresponding element of the second set in terms of those variables. For example, we might describe a bijection from ways of selecting a dozen doughnuts from five varieties to a 16-bit string with four 1’s as follows:
Recitation 15

Map a dozen doughnuts consisting of:

- chocolate, $c$
- lemon-filled, $l$
- sugar, $s$
- glazed, $g$
- plain, $p$

to the sequence:

$0\ldots0 1 0\ldots0 1 0\ldots0 1 0\ldots0$

$c l s g p$

Everyone in your group should write out complete answers— you’ll all benefit from the practice!

(a) Describe a bijection between the set of 30-bit sequences with 10 zeros and 20 ones and paths from $(0, 0)$ to $(10, 20)$ consisting of right-steps (which increment the first coordinate) and up-steps (which increment the second coordinate).

Solution. Map the 30-bit sequence $b_1b_2\ldots b_{30}$ to a path where the $i$-th step is right if $b_i = 0$ and up if $b_i = 1$.

(b) Find a bijection between the set of $n$-bit sequences and the set of all subsets of $\{x_1, x_2, \ldots, x_n\}$.

Solution. Map the $n$-bit sequence $b_1b_2\ldots b_n$ to a subset that contains $x_i$ if and only if $b_i = 1$.

(c) Mr. and Mrs. Grumperson have collected 13 identical pieces of coal as Christmas presents for their beloved children, Lucy and Spud. Describe a bijection between the set of all ways of distributing the 13 coal pieces to the two children and the set of 14-bit sequences with exactly 1 one.

Solution. Map a distribution in which Lucy gets $l$ pieces and Spud gets $s$ pieces to a 14-bit sequence with $l$ zeros, a one, and then $s$ zeros.

(d) On Christmas Eve, Mr. and Mrs. Grumperson remember that they have a third child, little Bottlecap, locked in the attic. Describe a bijection between the set of all ways of distributing the 13 coal pieces to the three children and the set of 15-bit sequences with exactly 2 ones.

Solution. Map a distribution in which Lucy gets $l$ pieces, Spud gets $s$ pieces, and Bottlecap gets $b$ pieces to a 15-bit sequence with $l$ zeros, a one, $s$ zeros, a one, and $b$ zeros.

(e) On reflection, Mr. and Mrs. Grumperson decide that each of their three children should receive at least two pieces of coal for Christmas. Describe a bijection between the set of all ways of distributing the 13 coal pieces to the three Grumperson children given this constraint and the set of 9-bit sequences with exactly 2 ones.

Solution. Map a distribution in which Lucy gets $l \geq 2$ pieces, Spud gets $s \geq 2$ pieces, and Bottlecap gets $b \geq 2$ pieces to a 9-bit sequence with exactly $l - 2$ zeros, a one, $s - 2$ zeros, a one, and $b - 2$ zeros.
(f) Describe a bijection between the set of 110-bit sequences with exactly 10 ones and solutions over the natural numbers to the equation:

\[ x_1 + x_2 + \cdots + x_{10} \leq 100 \]

**Solution.** Let \( x_1 \) be the number of zeros before the first 1, \( x_2 \) be the number of zeros between the first and second 1, etc. Note that zeros after the tenth 1 do not contribute to the value of any of the variables \( x_1, \ldots, x_{10} \); this allows us to count solutions to the inequality (\( \leq 100 \)) rather than the equality (\( = 100 \)).

(g) Describe a bijection between solutions to the inequality in the preceding problem part and sequences \((y_1, y_2, \ldots, y_{10})\) such that:

\[ 0 \leq y_1 \leq y_2 \leq \cdots \leq y_{10} \leq 100 \]

**Solution.** Let \( y_i = x_1 + \cdots + x_i \) for each \( i \) from 1 to 10.

**Pigeonhole Principle**

**Problem 3.** Solve the following problems using the pigeonhole principle. For each problem, try to identify the pigeons, the pigeonholes, and a rule assigning each pigeon to a pigeonhole.

(a) In a room of 500 people, there exist two who share a birthday.

**Solution.** The pigeons are the 500 people. The pigeonholes are 366 possible birthdays. Map each person to his or her own birthday. Since there 500 people and 366 birthdays, some two people must have the same birthday by the Pigeonhole Principle.

(b) Suppose that each of the 115 students in 6.042 sums the nine digits of his or her ID number. Must two people arrive at the same sum?

**Solution.** Yes. The students are the pigeons, the possible sums are the pigeonholes, and we map each student to the sum of the digits in his or her MIT ID number. Every sum is in the range from 0 to \( 9 \cdot 9 = 81 \), which means that there are 82 pigeonholes. Since there are more pigeons than pigeonholes, there must be two pigeons in the same pigeonhole; in other words, there must be two students with the same sum.

(c) In every set of 100 integers, there exist two whose difference is a multiple of 37.

**Solution.** The pigeons are the 100 integers. The pigeonholes are the numbers 0 to 36. Map integer \( k \) to \( k \mod 37 \). Since there are 100 pigeons and only 37 pigeonholes, two pigeons must go in the same pigeonhole. This means \( k_1 \mod 37 = k_2 \mod 37 \), which implies that \( k_1 - k_2 \) is a multiple of 37.
