Problem Set 10

Due: 2:35pm in lecture, Tuesday, November 28, 2000.

Be sure to indicate your TA's name clearly on the solutions you turn in.

Self-study Read: Lecture notes, Rosen Sections 4.4 and 4.5.
Self-study problems (not to be handed in): 4.4: 13, 33. 4.5: 19, 23.

Policy on collaboration If you collaborated with someone on the problem sets, you should mention their names on top of the problem set. If you did not collaborate with anyone, you should explicitly say so. As a reminder, the write-up of your solutions should be entirely your own.

Problem 1 Suppose that 5 men out of 100, and 25 women out of 10,000 are colorblind. A colorblind person is chosen at random from a population with equal numbers of males and females. What is the probability of this person being male?

Problem 2 Suppose that a resident of Boston chosen at random is a Red Sox fan (The Curse notwithstanding) with probability 0.90. Also suppose that a resident chosen at random is a Celtics fan (probably still living in the Bird-McHale-Parish era) with probability 0.75, and that a resident Red Sox fan chosen at random is a Celtics fan with probability 0.80. Now suppose that a resident is chosen at random from among those that are *not* Red Sox fans. What is the probability that such a resident is a Celtics fan?

Problem 3 A population consists of c_1 members of type 1, c_2 members of type $2, \cdots, c_n$ members of type n. A set of k members is drawn from the population without replacement.

(a) Find the probability that exactly i members of type 1 were chosen.

(b) Find the probability that exactly i members of class 1 and exactly j members of class 2 were chosen.

Problem 4 In London, half of the days have some rain. The weather forecaster is correct 2/3 of the time – i.e. the probability that it rains, given that she has predicted that it will rain, and the probability that it does not rain given that she has predicted that it does not rain, are both equal to 2/3. When rain is forecast, Mr. Pickwick takes his umbrella. When rain is not forecast, he takes it with probability 1/3.

(a) Find the probability that Pickwick has no umbrella, given that it rains.

(b) Find the probability that it doesn't rain, given that he brings his umbrella.

Problem 5 Let A, B, C be events of some experiment. For each of the following statements, prove it if it is true or give a counterexample if it is false:

(a) If C is independent of A, and C is independent of B, then C is independent of $A \cup B$.

(b) If C is independent of A, and C is independent of B, and C is independent of $A \cap B$, then C is independent of $A \cup B$.

Problem 6 Compute the probabilities of the following three events and determine which one is most likely. Assume that the dice are fair, 6-sided, and mutually independent.

(a) Rolling at least one 6 when six dice are rolled.

(b) Rolling at least two 6's when twelve dice are rolled.

(c) Rolling at least three 6's when eighteen dice are rolled.
