

# Message Shuffling to Prevent Hash Extension Attacks

Elizabeth Reid, Chris Wilkens, Christina Wright

# Outline

---

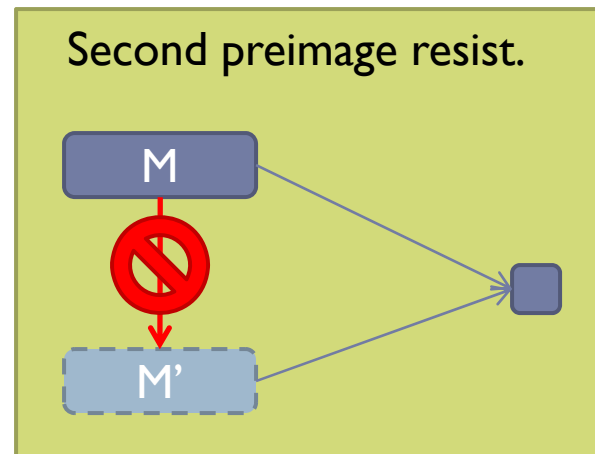

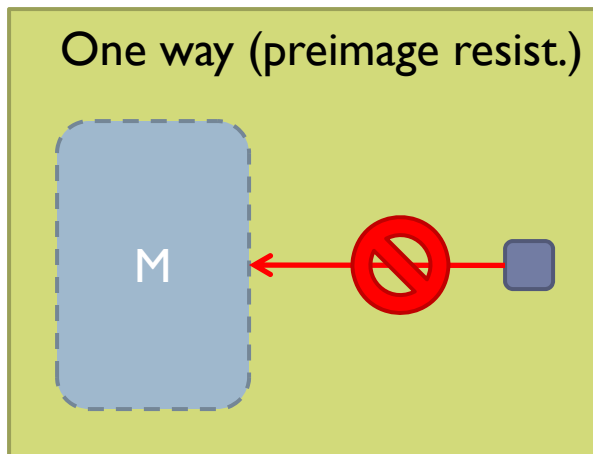

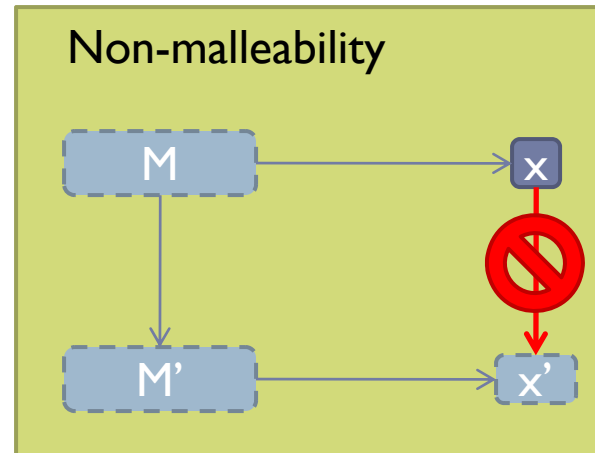

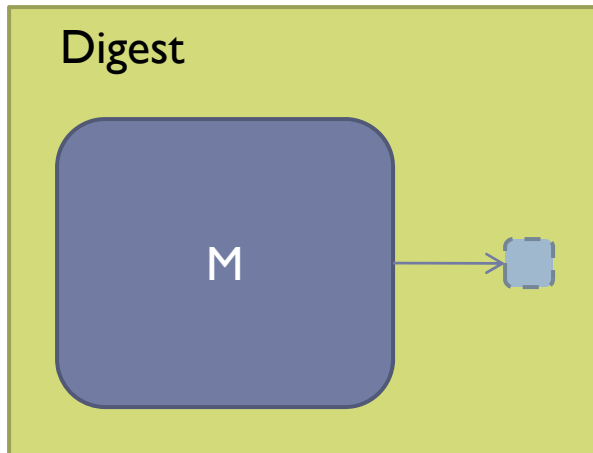

- ▶ **Hash Review**
  - ▶ Properties
  - ▶ Implementation & Issues
- ▶ **Our Solution**
- ▶ **Proof of Security**
- ▶ **Implementation & Results**

# Hash Review

# Desirable Properties

---

# Implementation

---

## ▶ Compression Function

- ▶ Fixed length input
- ▶ Ideal hash properties
  - ▶ Collision resistance
  - ▶ Pseudo-random function
  - ▶ Random oracle

## ▶ Hash Domain Extension

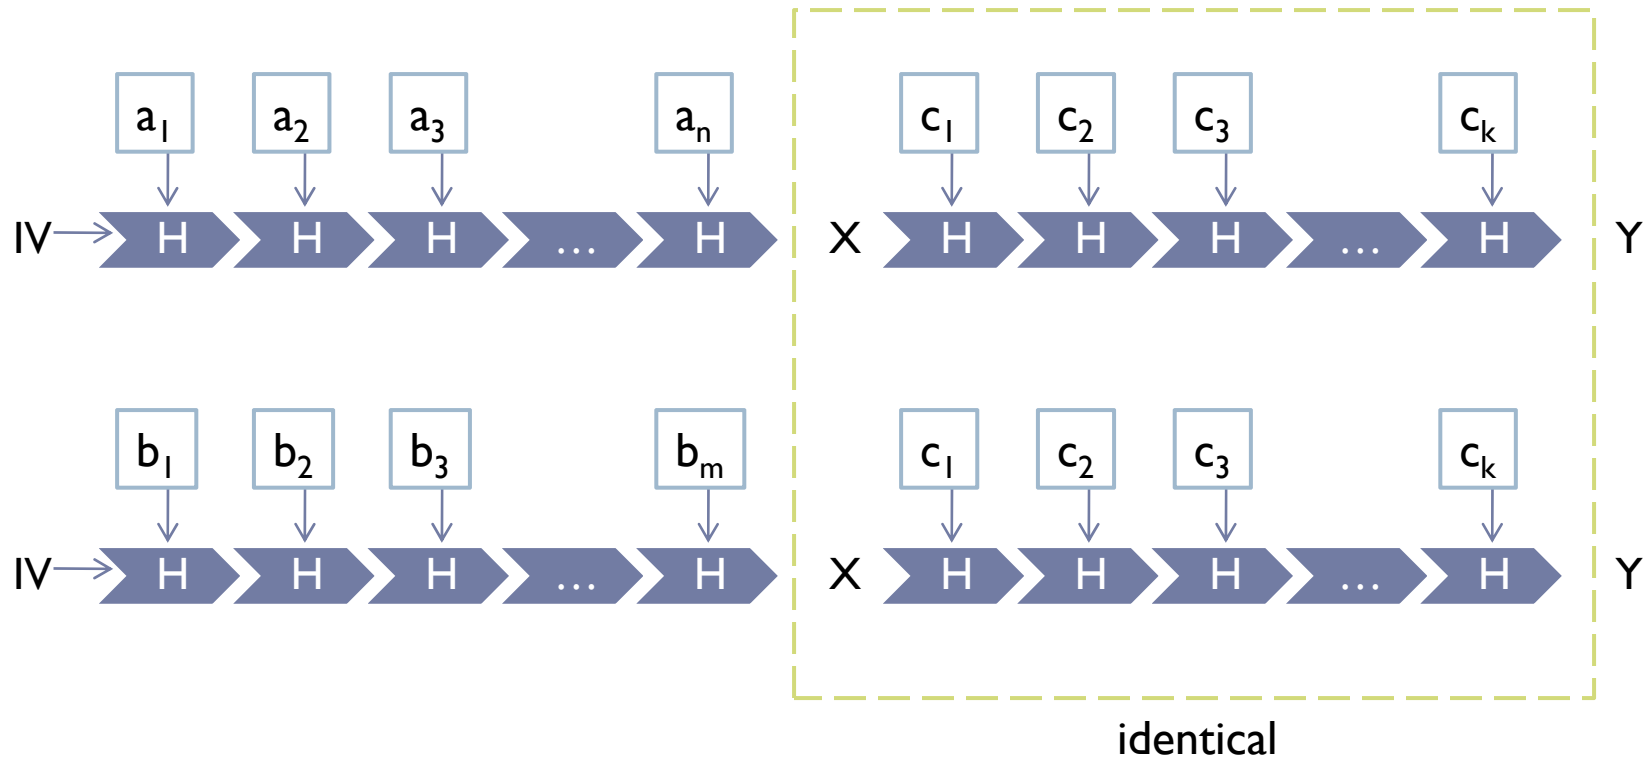

- ▶ Arbitrary length input
- ▶ Preserves hash properties

### Merkle-Damgård

# Merkle-Damgård Extension Attack

▶  $H(A) = H(B) \rightarrow H(A||C) = H(B||C)$

# Existing Solutions to Extension Attack

---

- ▶ **Double Hashing**
  - ▶  $h_1(h_1(M)||M)$
  - ▶ Requires reading data twice
- ▶ **Prefix-free**
  - ▶ Restrict input messages

Our Idea

# Our Contribution

---

## GOALS

- ▶ Prevent extension attacks
- ▶ Improve collision resistance
  - ▶ Particularly multicollisions
- ▶ Only read message once

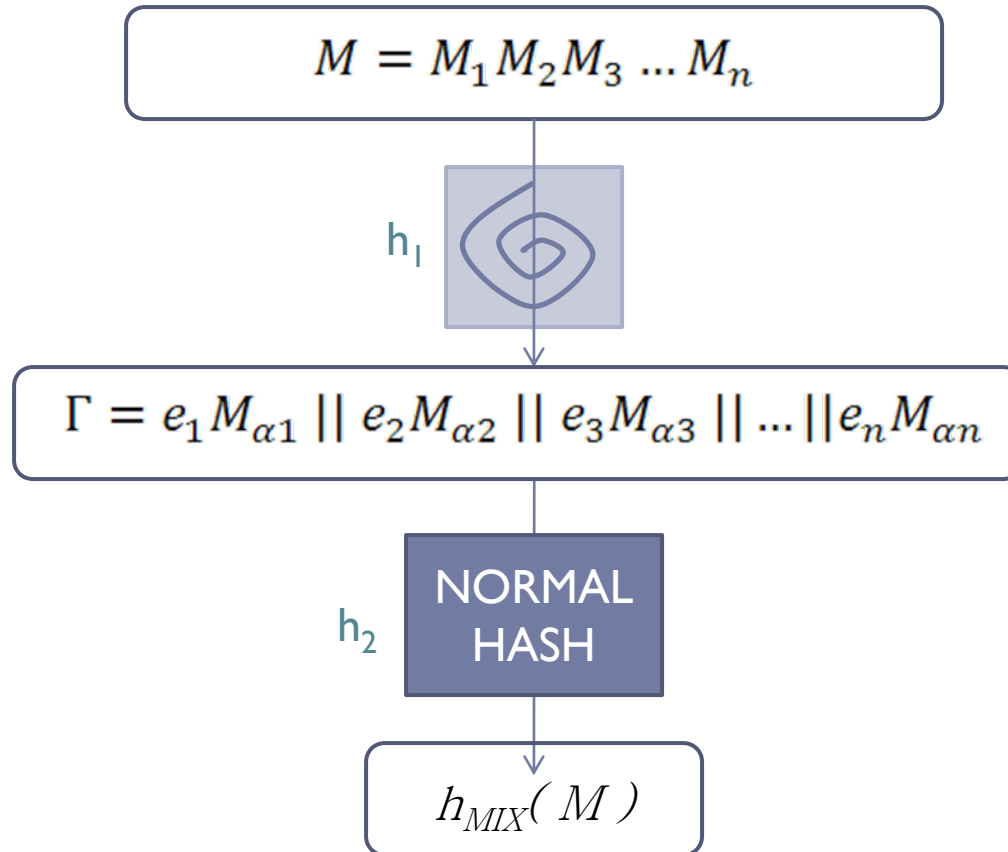

## ACHIEVEMENTS

- ▶ Proved secure against extension attacks
- ▶ Hypothesized increased collision resistance
- ▶ Practical speed and space requirements

How it works

Determine e values

$$h_1(m_1 \parallel m_2 \dots \parallel m_k) \\ = e_1 \parallel e_2 \parallel \dots \parallel e_k$$

# Implementation & Results

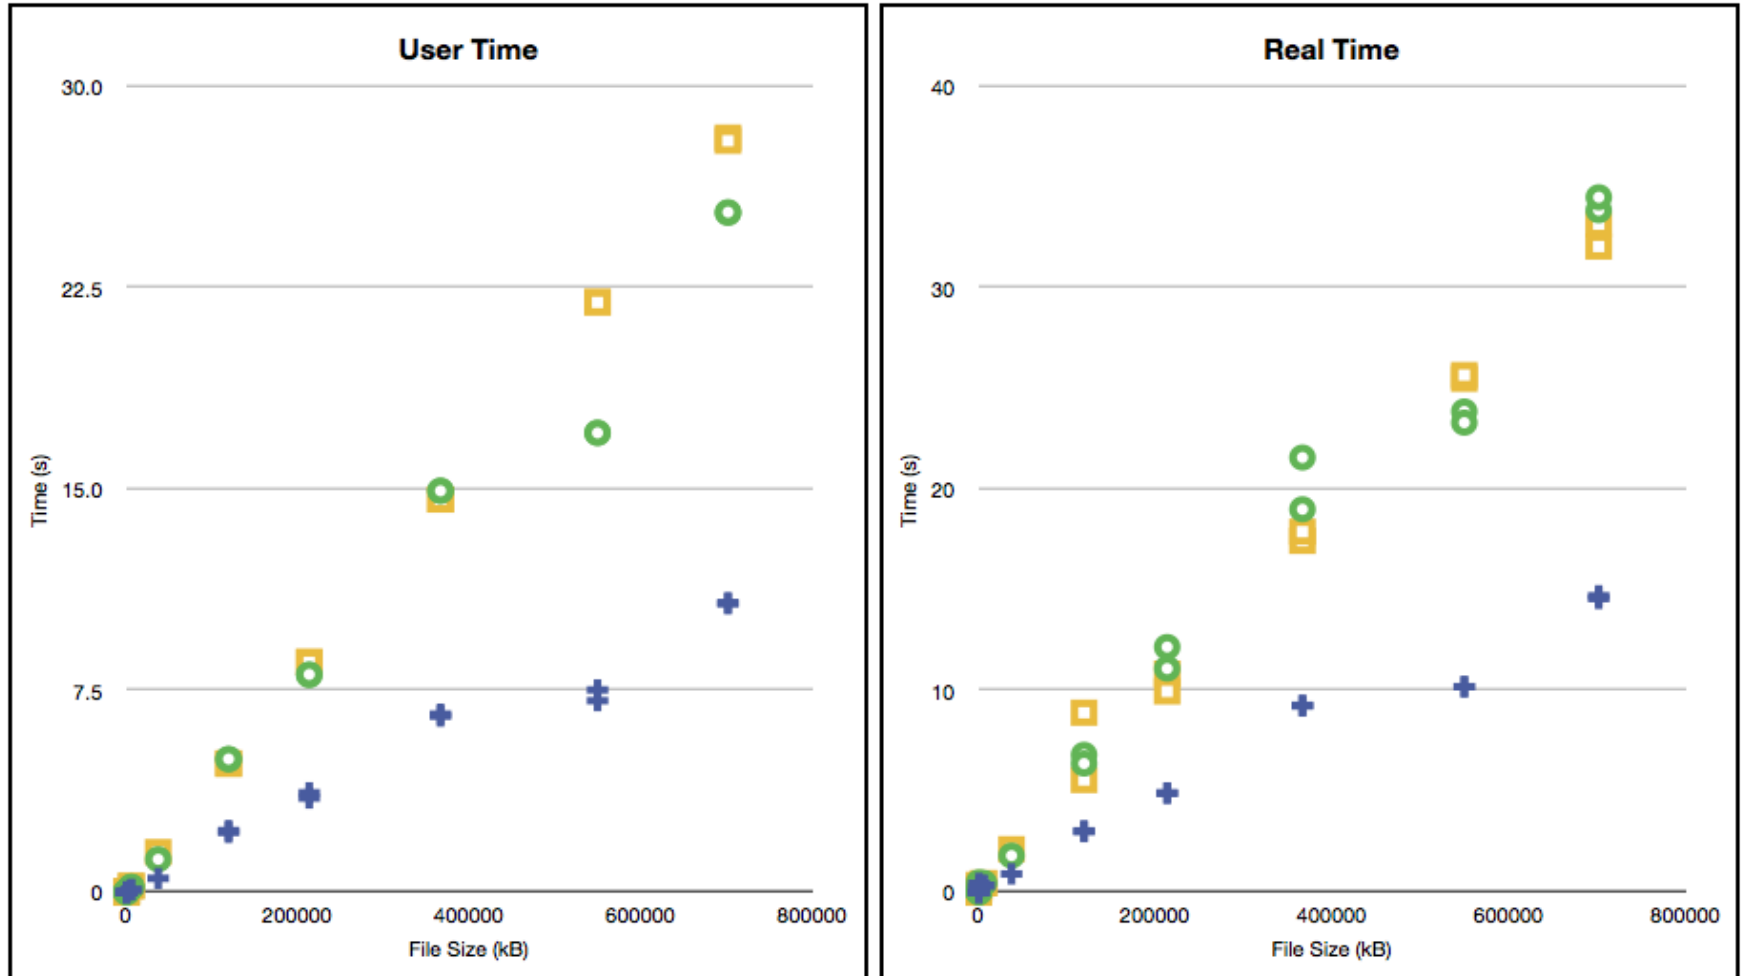

# Implementation

---

- ▶ We implemented  $h_{MIX}$  in C
  - ▶ We used SHA-1 for both  $h_1$  and  $h_2$
- ▶ Expect runtime  $\sim 2.2$  times SHA-1
  - ▶ All bits of the message are hashed twice
  - ▶ Extra time to move blocks
  - ▶ The e values add  $\sim 20\%$  to the hashed material

# Performance Results

+ SHA-1    ○ Prepended Double Hash    □ Hmix

# Conclusion

---

- ▶ **Theory – with one pass through  $M$ ,**
  - ▶  $h_{MIX}$  is not provably secure against message extension attacks (see paper)
  - ▶  $h_{MIX}$  is not immediately vulnerable to known multicollision attacks
- ▶ **Practice**
  - ▶  $h_{MIX}$  is computationally equivalent to hashing  $M$  twice while reading the file once and using 0.5 KB of internal state
