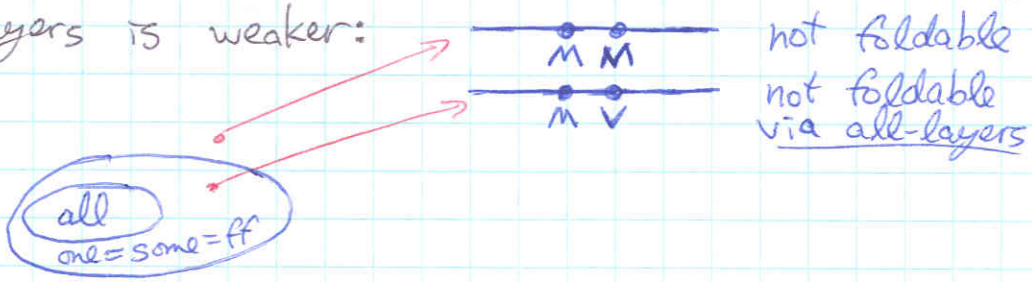
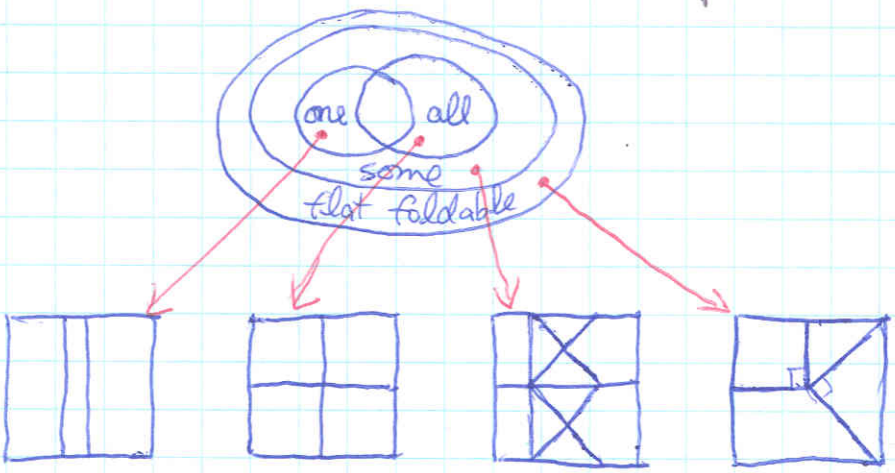
- mingling result ⇒ one-layer simple foldability
  = some-layers simple foldability
  = flat foldability in 1D

  (crimps & end folds can be executed with one layer)

- all-layers is weaker:



- in 2D, the picture is more complex:



- to be one-layer simply foldable, must be essentially 1D
- some-layers simple foldability is what we already solved
- all-layers simple foldability reduces to 1D all-layers problems
